Soil profile was a poorly drained soil. Low chroma (2 or less) or iron/manganese accumulations signifying seasonal high groundwater (seasonal saturation) was 10 inches. General landscape was of rolling topography. Soil pit site was a convex slope of 0-1% (S)<sup>4</sup> with runoff entering from the north. Bedrock greater than 48 inches.

Detailed Soil Description<sup>1</sup> / Interpretations - Pit 3

Soil profile was a poorly drained soil. Low chroma (2 or less) or iron/manganese accumulations signifying seasonal high groundwater (seasonal saturation) was 0 inches. General landscape was of rolling topography. Soil pit site was a concave slope of 0-1% (S)<sup>4</sup> with runoff entering from the north. Bedrock greater than 48 inches.

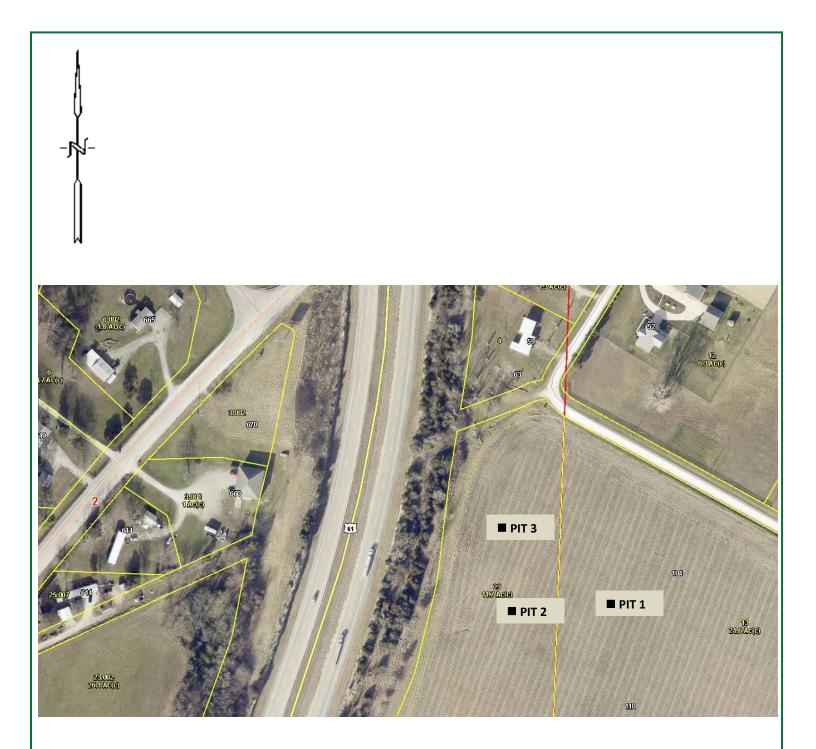

Remarks: New construction for on-site septic system for a three-bedroom home. NOTE: For best results Do Not disturb, pasture, or drive heavy machinery on lateral field area at any time. The suitability of the soils will be affected and the inspector may not approve area if it has been disturbed prior to construction. Proposed drain field area should be fenced off to help prevent any disturbance. GAINES SOIL CONSULTING does not represent nor warrant the operation or proper functioning of installed system for any period of time.
